MANAGE YOUR FUTURES TRADES GLOBALLY WITH REFINITIV™ REDI® EMS

Futures Trading

With the powerful multi-asset capabilities of Refinitiv™ REDI® EMS, users can trade futures products globally through multiple brokers. The platform’s robust, intuitive features allow you to trade outrights, spreads and options on futures across major futures markets worldwide.

Multi-broker
Access the desks and low-touch tools of nearly every major global broker to trade spreads, outrights and options on futures worldwide.

Next expiration logic
Quickly roll forward or back a product’s expiration date by a specified number of days with one click. Users can also link products by next expiration.

Auto expire
Set expired contracts to be automatically removed from the Quote Monitor or dynamically roll contracts forward to the next expiration date.

Advanced trading tools
Use the REDI EMS Price Ladder (pictured) to visualize depth of market and trading volume, as well as:

- Rapidly buy and sell at your desired price point by clicking directly on that price
- View volume-weighted average price (VWAP), total volume per price point and depth of market, all from one window
- Use REDI EMS HotKeys to quickly route your order to your desired destination
- Quickly link any futures product to the Price Ladder with REDI EMS global futures coverage
Key features

1. The **Quote Monitor** allows you to create custom groupings and signals for a list of products, which can highlight intraday changes on parameters. In this instance, there is a custom signal configured to show products that are trading higher than their daily high in green.

2. The **Spread Matrix** displays market prices, implied prices and the combined quantity at given price points, enabling you to spot opportunities in the outright markets versus the listed spreads. When the market has additional quantity (implied quantity) in the outright markets, the contract will display in white for quick visualization.

3. You can link windows by both product and next expiration. Here, the ESZ4-H5 contract is driving the population of the ESH5-M5 contract.

4. Large **Buy/Sell buttons** allow users to see the spread logic for an exchange-listed spread. In this example, the E-Mini spread has logic to sell the near expiration and buy the far expiration when a user buys the spread.

5. The **Order tab** visualizes all orders on REDI EMS, allowing you to monitor your fills, cancel orders and view rejections, all from the same tab. Users can also add custom fields to this view.

6. **Montage II** provides the depth of book, recent fills, volume, VWAP and your open orders, all from a single window. Users have the ability to quickly trade at any of the displayed price levels simply by clicking on the Bid or Ask Action column.

7. REDI EMS was developed with a focus on speed and usability. **HotKeys** can be configured to automatically route orders to your desired broker destination, with or without all the algo parameters prepopulated. The Quantity buttons also help you to quickly add or remove the listed quantities to/from your order before sending it to the market.
