Introduction

Refinitiv Diversity & Inclusion Ratings

Diversity and Inclusion (D&I) ratings powered by Refinitiv ESG data are designed to transparently and objectively measure the relative performance of companies against factors that define diverse and inclusive workplaces.

It is designed on the hypothesis that companies tracking, reporting and achieving on measures of diversity, inclusion and people development will, collectively and over time, offer diversification away from portfolios constructed using different selection criteria such as market capitalization alone\(^1\). Refinitiv's D&I rating provides the information to help users identify long-term opportunities and risks in their investments.

Available through Eikon\(^8\), the D&I rating ranks over 9,000 publicly listed companies, as measured by 24 separate metrics across four key pillars. The data is gathered from publicly available information sources and is manually collected to ensure that the information is standardized, comparable and reliable. All of the ESG data collected is quality controlled and verified in a rigorous process by our experienced analysts and robust automated checks.

Refinitiv ESG Data

Refinitiv provides objective and transparent environmental, social and governance (ESG) information and analysis tools to enable professional investors to benchmark, compare and integrate extra-financial information into their investment processes. We offer the most comprehensive ESG database containing information on more than 9,000 global companies and over 450 measures, including all exclusion (ethical screening) criteria and all aspects of sustainability performance, collected and standardized by more than 150 experienced analysts to ensure data accuracy and comparability.

Refinitiv's ESG database provides the most in-depth coverage in the industry, tracking detailed ESG data on a broad range of companies, including the constituents of indices such as the S&P 500, ASX300, MSCI World, MSCI Emerging Markets, FTSE100, Bovespa and many more.

\(^1\) Past performance is not necessarily indicative of future performance
The data is gathered from publicly available information sources and is manually collected to ensure information is standardized, comparable and reliable. All of the ESG data collected is quality controlled and verified in a rigorous process by our experienced analysts and robust automated checks.

The public availability of ESG information varies across different countries, industries and market capitalizations. The ESG database is therefore more reflective of companies with a greater degree of ESG data disclosure. These include companies listed in countries where regulatory or investor demand favors such disclosure, companies in industries with a tradition of ESG transparency and companies with mid to large market capitalizations.

For more information or inquiries, visit Refinitiv ESG data.

**Data Source: Business Classifications**

The D&I ratings leverage the Business Classification (BC) from Refinitiv as the benchmark for some of the metrics and to calculate weights by industry group. BC is an industry classification system that is owned and operated by Refinitiv. The market-oriented system tracks the primary business of a corporation and reflects global industry practices by grouping together correlated companies that offer products and services into similar end markets.

BC is used by the investment community for navigation, aggregation and benchmarking. It provides a global standard for intelligently identifying peers, tagging research, aggregating financial content and transforming the torrent of news and information into insightful trends. It delivers a solid foundation for aggregating financial ratios, portfolio benchmarking and attribution analysis.
Calculation methodology

Introduction

The D&I rating is calculated on a quarterly basis after close of business on the final business day of each calendar quarter (determined using the New York Stock Exchange trading calendar) and using the most recent weekly data update from the ESG database. The new rebalance is effective at market open on the first business day of the new calendar quarter.

The D&I rating is calculated as follows:

- We select 24 measures that are relevant to diversity and inclusion out of more than 450 measures available in Refinitiv’s ESG database
- Each of these 24 measures is allocated to one of four pillars: diversity, inclusion, people development and controversies. The measures are dynamically weighted according to their availability within an industry or country
- Values for three of the four pillars are then calculated using a weighted average of their constituent measures
- A value for the controversies pillar is calculated as a simple average of its constituent measures.
- The overall D&I rating for each company is the simple average of the four pillar scores (each must be greater than zero for the company to be assigned an overall D&I rating).

Company selection and classification

The company selection procedure starts by taking the universe of companies covered by the ESG database. For each company, data for 24 measures is taken from the ESG database (for a list of the measures, see Appendix: ESG measures used). For each company, the measures used cover the latest Fiscal Year (FY) available.

From the ESG data, individual companies are identified using a unique company identifier. For each individual company, static data (organization name, region, country, ISIN, fiscal year, BC industry) and the 24 measures are identified for the latest FY. This process results in a data set or data dictionary for each company.

Once a data dictionary has been compiled for each company, free float market capitalizations are determined and companies are classified according to their capitalization. Classifications are determined on a country basis, in which the top 70% of
companies (by cumulative market capitalization value) are considered large cap and the companies in the 70% to 88% region of cumulative market cap are considered mid cap. All others keep the default small cap classification. Capitalization classification could potentially be done by region, but it is believed that a country-based classification is optimal.

The default configuration for the index rebalancing engine is to exclude inactive companies from the calculation steps below.

**Determining min/max values for measures**

To scale the scores of individual measures, it is necessary, for each measure, to calculate a minimum/maximum value for each measure in each of the BC industry groups. The complete set of companies under consideration is iterated through and the data dictionary for each is examined to update the data dictionary entries.

**Determining measure weights by industry group/country**

Many individual measures are weighted based on the availability of that measure across companies in that industry group (BC Level 3) or country. To determine those weights, it is necessary to first:

1. Perform a count for each measure, by both industry group and country. For Boolean measures, only Yes ('Y') values are counted. Values that are missing, empty (null), or NA are not counted.
2. Convert the raw counts to percentages, when there are more than 10 companies available. If there are 10 or fewer in the industry group or country, the percentage is set to zero and a pillar score is not calculated.
3. Use the availability percentages to identify boundaries for assigning quartiles (i.e. for a given measure and industry group or country, determine into which quartile that percentage falls).

Once the steps above are complete, the quartile assignments can be used to determine the weighting (25%, 50%, 75% or 100%) for that measure within its industry group or country. In the final step, each company is tagged if it belongs to either an industry or a country for which there are insufficient members to form a benchmark.

**Calculating diversity / inclusion / people development pillar ratings**

The diversity, inclusion and people development pillars all use the same methodology to calculate the pillar ratings. The steps are:

1. Determine the measures involved in the pillar’s calculation (see Appendix: ESG measures used for a mapping of measures to pillar).
2. For each company:
   a. For each measure used in the pillar:
      i. Determine the measure weight (based on whether the measure is weighted relative to industry group or to country)
      ii. Add the measure weight to the pillar weight total
      iii. If the measure is present:
         1. Convert non-numeric values to the appropriate numeric value (i.e. Booleans are mapped to 0/1, strings are mapped as determined by a data file)
         2. If numeric value is not a number (e.g. value was NA) or a Boolean ‘N’ (No) value, increase transparency count
         3. Obtain the appropriate min/max value for the measure within the industry group
         4. Calculate the raw score as:
            \( \frac{\text{numericValue} - \text{minValue}}{\text{maxValue} - \text{minValue}} \)
   b. Use the raw scores for each measure to create the normalized scores for each measure. Each normalized measure score is computed as:
      \( \text{rawScore} \times \frac{\text{MeasureWeight}}{\text{sumOfWeights}} \)

The sum of the normalized scores, rounded to an integer value, forms the overall score for the company for that pillar.
Calculating controversies scores

The methodology for calculating the controversies score is considerably simpler. It is based on the company’s market cap classification, and for each measure, whether any controversies were reported (the measures contain the number of controversies, but this is not taken into account). The methodology steps are:

1. Determine the measures involved in the pillar’s calculation (see the column ‘Pillar’ in the Measure Names declarative file, described in the appendix below)
2. For each company:
   a. For each measure used in the pillar:
      i. If measure is not present for the company or is NA, score 100 for the measure (no controversies is considered a positive)
      ii. If the measure is present and is a positive number, score based on market capitalization (large = 50; mid = 25; small = 0)
   b. The score for the controversies pillar is the average score for the individual measures, rounded to an integer value

Controversies pillar is the only pillar in which the measures are updated every two weeks, rather than on a fiscal year basis.

Final rating assembly

Overall rating is based on a simple average of the four individual pillar scores. A company must have non-zero scores on all four pillars to have an overall rating computed. The decision was made to omit the assignment of overall scores to companies scoring zero on one or more pillars. The rationale behind the decision was that their inclusion would reduce the mean score, making the ‘average’ significantly lower. For the overall rankings, the intent was to rank only those companies that are actively tracking and reporting on all four pillars.
Diversity and Inclusion scoring example

In this section, we will illustrate how a pillar score gets calculated using the data available in the ESG database as of June 2017. The sample company is Refinitiv, using the latest available data and the inclusion pillar score is 67%.

The following five measures make up the inclusion pillar:

<table>
<thead>
<tr>
<th>Pillar</th>
<th>Eikon Item Code</th>
<th>Description</th>
<th>Benchmark group</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inclusion</td>
<td>TR.USLGBTEqualityIndex</td>
<td>The score of the company in the HRC corporate equality index from the Human Rights Campaign Foundation.</td>
<td>Country</td>
</tr>
<tr>
<td>Inclusion</td>
<td>TR.FlexibleWorkingHours</td>
<td>Does the company claim to provide flexible working hours or working hours that promote a work-life balance?</td>
<td>Industry</td>
</tr>
<tr>
<td>Inclusion</td>
<td>TR.DayCareServices</td>
<td>Does the company claim to provide day care services for its employees?</td>
<td>Country</td>
</tr>
<tr>
<td>Inclusion</td>
<td>TR.EmployeesWithDisabilities</td>
<td>Percentage of employees with disabilities or special needs</td>
<td>Country</td>
</tr>
<tr>
<td>Inclusion</td>
<td>TR.HIVAIDSProgram</td>
<td>Does the company report on policies or programs on HIV/AIDS for the workplace or beyond?</td>
<td>Country</td>
</tr>
</tbody>
</table>

Refinitiv’s country group is United States and its industry group (BC level 3) is Professional & Commercial Services. In the rebalance used for the example here, for the scoring universe (1978 companies), the set of companies within the United States group is 748, while the set of companies within the industry group is 60.

The raw measure values are obtained, then the min/max value for the measure within the benchmark group is extracted, and applying the formula 

\[ \frac{\text{numericValue} - \text{minValue}}{\text{maxValue} - \text{minValue}} \]

we convert the raw measure value to a raw numeric value.

Individual measure weights are computed using counts within the appropriate KPI peer group (method described in the previous section), where counts are converted to percentages, which are then used to determine quartiles.

For example, the measure representing the HIV-AIDS program has a weight of 0.75. This was derived by performing a count of the ‘Y’ values within the benchmark group: country (67), converting that to a percentage (67/748*100=8.957%). Over all the countries for this measure, this score determined that the United States would fall in the third quartile (0.75).

This same process was used to determine the measure weights for each measure in the pillar as illustrated in the table below. The sum of the weights in the inclusion pillar is therefore 3.75. The raw numeric values and the weights are used to compute the normalized score for each measure.

<table>
<thead>
<tr>
<th>Eikon Item Code</th>
<th>Raw Data</th>
<th>Min/Max Value</th>
<th>Raw Numeric Value</th>
<th>Measure Weight</th>
<th>Normalized Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>TR.USLGBTEqualityIndex</td>
<td>100</td>
<td>-25,100</td>
<td>(100-(-25)) / (100-(-25)) = 1</td>
<td>1</td>
<td>1*(1/3.75)= 0.266666</td>
</tr>
<tr>
<td>TR.FlexibleWorkingHours</td>
<td>Yes</td>
<td>0, 1</td>
<td>Yes/No, converts to 1</td>
<td>0.75</td>
<td>1*(0.75/3.75)= 0.2</td>
</tr>
<tr>
<td>TR.DayCareServices</td>
<td>No</td>
<td>0, 1</td>
<td>Yes/No, converts to 0</td>
<td>1</td>
<td>0*(1/3.75)= 0</td>
</tr>
<tr>
<td>TR.EmployeesWithDisabilities</td>
<td>N/A</td>
<td>0.0073, 0.054 (0.73%, 5.4%)</td>
<td>No value collected (NA), converts to 0</td>
<td>0.25</td>
<td>0*(0.25/3.75)= 0</td>
</tr>
<tr>
<td>TR.HIVAIDSProgram</td>
<td>Yes</td>
<td>0, 1</td>
<td>Yes/No, converts to 1</td>
<td>0.75</td>
<td>1*(0.75/3.75)= 0.2</td>
</tr>
</tbody>
</table>

Inclusion pillar final score is calculated as round \((0.266666+0.2+0+0+0.2)) = 0.67 = 67\%.

Date of issue: September 2020
## Appendix 1 – ESG measures used

<table>
<thead>
<tr>
<th>Pillar</th>
